Dear Sir/Madam,

My name is Niv Arad, I am 26 years old, currently studying for a degree in computer science at Afeka College Of Engineering. I have developed a set of skills that I believe make great asset for whichever place I will work.

During my military service, I was a communications company commander in a classified, highly operational unit with more than 20 people under my command, both regular and career soldiers. I have experience with hard work, managing missions, leading projects, people management, and performing under pressure. In addition, I am highly determined and motivated, I have a great work ethic, I am a team player with a "can-do" attitude, and have good interpersonal skills.

During my studies, I acquired skills in a few programming languages. While Java is my main programming language, I also have experience with Python, Javascript and C#. In addition to this, I am following external courses and projects - mainly with Udemy to enrich my knowledge and become a better programmer.

Some of the projects I made vary between building few mini games in Java ,contributing to a application that manages crypto trading bots that were made in 3Commas platform , and building some websites for myself.

I am currently in the mid of my second year of my studies, with a 95 GPA and will be looking to have my first Junior job and experience starting in the summer . I do believe that with my passion for the computer science field and my crave for knowledge I can really benefit from the experience working at your's place while still perform to your expectations and produce results.

With best regards,

Niv Arad
